

ABSTRACT OF THE INVENTION

1  
2 A liquid toner for electrostatic imaging which  
3 includes: an insulating non-polar carrier liquid, at least  
4 one charge director and toner particles dispersed in the  
5 carrier liquid. The particles include a core material which  
6 is unchargeable or weakly chargeable by the at least one  
7 charge director, but which is otherwise suitable for use as  
8 a toner material and a coating of at least one ionomer  
9 component in an amount effective to impart enhanced  
10 chargeability to the ordinarily unchargeable or weakly  
11 chargeable particles.
